

# INNOVATIONS GAINED FROM COVID-19

While COVID-19 has placed unparalleled demands on the healthcare system, the industry's response has vividly demonstrated its resiliency and ability to bring innovations to market quickly. Medical professionals and technology experts have achieved remarkable advances reshaping the industry in a short amount of time. Here is a list of healthcare developments that have emerged from the COVID-19 pandemic.

## Digital Health:

Patients seeking quick and reliable primary care have put telemedicine platforms in the spotlight. Solutions like 24/7 telehospitalist remote screening and patient information lines provide ample opportunities to serve rural populations and communities that have minimal access to care.

## Personal Protective Equipment (PPE):

With the massive need for PPE to stop the spread of COVID-19, companies have teamed up to reimagine how these vital items are made and distributed with the help of emerging technologies. Today, PPE is essential for medical professionals, healthcare workers, and even the public. It is how the world has managed to keep moving.

## Ventilators:

The high demand for ventilators left the healthcare system with shortages and strains. Thanks to the ingenuity of medical professionals and engineers, many hospitals now have access to reliable and cost-effective ventilators to care for the sick.

## COVID-19 Vaccine:

Technology used for the COVID-19 vaccine proved its effectiveness for the companies involved. This medical breakthrough will accelerate and scale the development of new vaccines, including the possibility of new medication options for cancer diagnoses.

## COVID-19 Discoveries:

Researchers are working to understand the complexity of the virus. Even though it hasn't been eliminated, numerous ongoing clinical trials and studies suggest new ways to detect, treat, and stop the spread.
